 Sylhet, Bangladesh

Mobile Application Developer at a healthcare SaaS company who took ownership of quality for a live platform end to end, nobody assigned it, I saw the gap and built the automation, CI, and standards to close it. I grew a Playwright suite from 220 to 298 tests, introduced a testing standard that fixed tests reporting green while the UI was actually broken, and wired CI straight into Slack so failures surfaced the same day instead of at the next release. On two other products I held myself to that same bar solo: a 978-test unit and contract suite before one App Store launch, and PCI/HIPAA-grade audit logging and security design on the other.

SKILLS

- **Test Automation:** Playwright · Manual and automated QA · Unit and contract testing · Reliable-selector standards (data-testid)
- **CI/CD & Release Quality:** GitHub Actions · Slack-synced PR results · Scheduled regression sweeps · Test-gated PR sequencing
- **Debugging & Defect Diagnosis:** Sentry monitoring · Root-cause investigation · State-machine failure analysis on AI features
- **Data & Backend:** SQL · Firebase · API and contract-level testing
- **Compliance & Data Integrity:** PCI/HIPAA compliance verification · Append-only audit log design
- **Technical Fluency:** Swift · SwiftUI · React Native · TypeScript

RELEVANT EXPERIENCE

Mobile Application Developer (QA Owner, Harp Platform)

09/2025 – 07/2026 | Boston, MA

Lab3 (Healthcare Payments & SaaS), Remote 

- Owned QA for the Harp platform end to end, nobody assigned it, from manual testing through full automation: grew the Playwright suite from 220 to 298 tests, introduced a data-testid standard that fixed tests reporting green while the UI was actually broken, and built a GitHub Actions CI pipeline posting results to Slack on every PR plus scheduled regression sweeps. Sequenced PR reviews and merges based on prior test results, so a merge never landed ahead of the testing that validated it. Surfaced and fixed 13 payment defects this way, most self-identified before being reported by anyone else.
- Took GenFit, an AI fitness app, from a 500-word brief to a public App Store launch in 8 weeks, solo: held a quality bar of 978 unit and contract tests before submitting to the App Store, integrated Apple HealthKit and Android Health Connect, and shipped 4 AI-backed features. Built specifically for a large US gym chain, which reports over 1,300 members onboarded so far.
- Rebuilt BillPay-POS, Lab3's own product, from a clinic's existing web app into a PCI- and HIPAA-compliant iPad point-of-sale with a self-service kiosk mode, solo, no design handoff: designed the kiosk's patient-facing security model and an append-only audit log covering 6 tracked actions on patient data, shipped 3 payment paths (terminal, Bluetooth reader, manual entry), and coordinated the AnyPay reader integration directly with AnywhereCommerce's engineering team.
- Managed releases across both Apple distribution channels (public App Store, TestFlight), including recovering a capabilities-related App Store rejection through rescoping.
- Delivered 160 tickets total across two shipped products and the Harp platform, sequencing work by risk so the highest-uncertainty items surfaced early.
- Collaborated daily in Agile/Scrum with backend, QA, and product teams across US and Bangladesh time zones, and was recognized as Lab3's Most Universal Employee at the annual company retreat for contributing across the BillPay-POS, Harp, and GenHealth teams in a single year.

iOS Developer Intern

02/2025 – 08/2025 | Dhaka

SahiTech Ltd.(Remote) 

- Owned three widget and watch-face collections end to end within an existing product line (53 widgets, 7 watch faces) on a fixed roadmap and release cadence.
- Built reusable SwiftUI components adopted by the rest of the team across future collections.
- Took part in sprint planning and code review on a fully remote, cross-timezone team.

EDUCATION

BSc Engineering in CSE

01/2020 – 09/2025 | Khulna, Bangladesh

Khulna University Of Engineering & Technology
